

Columbia Base Station Energy Management System Processing

Where is the Columbia Generating Station located?

The Columbia Generating Station (CGS), formerly known as WNP-2, is sited on land leased from DOE on the Hanford Site. The total area of the project is 1089 acres. The Washington Public Power Supply System (WPPSS), now Energy Northwest, filed an application with the state in 1971 for construction and operation of WNP-2.

What is a base station power consumption model?

In recent years, many models for base station power con-sumption have been proposed in the literature. The work in proposed a widely used power consumption model, which explicitly shows the linear relationship between the power transmitted by the BS and its consumed power.

What type of power plant does Columbia have?

About Columbia Generating Station Type: General Electric boiling water reactorGeneration: 1,207 megawatts (gross) Location: 10 miles north of Richland, Washington

How does Columbia make carbon-free megawatts?

Columbia Generating Station makes millions of carbon-free megawatts by boiling water into steamthat turns turbine and spins a generator. The nuclear plant uses uranium, a naturally occurring element, as the primary fuel source.

Are cellular base stations a future-proof power model?

Debaillie, C. Desset, and F. Louagie, "A flexible and future-proof power model for cellular base stations," in IEEE 81st Vehicular Tech-nology Conference (VTC Spring), 2015, pp. 1-7. S.

What are energy management systems (EMS)?

Energy Management Systems (EMS) play an increasingly vital role in modern power systems, especially as energy storage solutions and distributed resources continue to expand.

The Daiichi Liquid Waste Processing (DLWP) system is being designed to treat the liquid radiological waste. Columbia Energy participated in the conceptual design of the control ...
