

Lead-acid battery management for communication base stations in Liberia

Why do telecom base stations need a battery management system?

As the backbone of modern communications, telecom base stations demand a highly reliable and efficient power backup system. The application of Battery Management Systems in telecom backup batteries is a game-changing innovation that enhances safety, extends battery lifespan, improves operational efficiency, and ensures regulatory compliance.

Are lithium ion batteries better than lead-acid batteries?

Lithium-ion batteries typically have a longer cycle lifecompared to lead-acid batteries. Telecom batteries must operate effectively across various temperatures. Lead-acid batteries may struggle in extreme heat or cold, while lithium-ion options generally perform better under diverse conditions.

Why do telecom base stations need backup batteries?

Backup batteries ensure that telecom base stations remain operational even during extended power outages. With increasing demand for reliable data connectivity and the critical nature of emergency communications, maintaining battery health is essential.

What are the different types of lead-acid batteries?

Lead-Acid Batteries: Commonly used due to their reliability and cost-effectiveness. They come in two main types: Flooded Lead-Acid (FLA): Require regular maintenance and electrolyte checks. Valve-Regulated Lead-Acid (VRLA): Maintenance-free and sealed, making them ideal for remote locations.

PACE communication base station solution covers 50-200 ampere current, supports 5-20 ampere charging current limit, and supports up to 64 sets of batteries in parallel to meet diverse needs.
