

# What other light can photovoltaic panels use to generate electricity

## How do photovoltaic cells work?

Simply put, photovoltaic cells allow solar panels to convert sunlight into electricity. You've probably seen solar panels on rooftops all around your neighborhood, but do you know how they work to generate electricity?

#### What are photovoltaic (PV) solar cells?

In this article,we'll look at photovoltaic (PV) solar cells,or solar cells,which are electronic devices that generate electricity when exposed to photons or particles of light. This conversion is called the photovoltaic effect. We'll explain the science of silicon solar cells,which comprise most solar panels.

## Can a solar panel convert photons into energy?

The answer to each of these questions has to do with a solar panel's ability to convert photons into energy. The light that hits our Earth from the Sun is made up of many different wavelengths across the electromagnetic spectrum. Of this light, only about 42-43% is visible to the human eye.

#### How is sunlight manifested in a photovoltaic system?

Sunlight is manifested in several ways including visible light,infrared radiation,and ultraviolet light. Visible light - This is the portion of the solar spectrum that we can see. It is an essential component in photovoltaic systems, which convert solar energy to electrical energy.

#### How does a solar PV system generate electricity?

Solar PV systems generate electricity by absorbing sunlightand using that light energy to create an electrical current. There are many photovoltaic cells within a single solar module, and the current created by all of the cells together adds up to enough electricity to help power your home.

#### Can solar panels transform UV light into energy?

Another potential application of solar panels that could transform UV light into energy is putting solar panels on the light side of the moon. The Earth's atmosphere protects it from the majority of the Sun's powerful radiation and light. The moon has essentially no atmosphere, so the amount of UV light that reaches it is much larger.
