

## Working principle of base station distributed power supply

What are the components of a base station?

Power Supply: The power source provides the electrical energy to base station elements. It often features auxiliary power supply mechanisms that guarantee operation in case of lost or interrupted electricity, during blackouts. Baseband Processor: The baseband processor is responsible for the processing of the digital signals.

Does base station energy storage participate in the load power supply?

At this time, the base station energy storage not only participates in the load power supply, but also has certain absorption of wind-solar output when the wind-solar output is larger than the load demand (13:00,16:00). For scenario 3, it can be seen that the scenario has obvious complementary characteristics of the wind-solar power (5:00~20:00).

What is the energy storage output of a base station?

The energy storage output of base station in different types. It can be seen from Fig. 20 that the energy storage of the base station is charged at 2-3h, 20h and 24h, when the load of the system is at a low level, and the wind power generation is at a high level.

Why do base stations have a small backup energy storage time?

Base stations' backup energy storage time is often related to the reliability of power supply between power grids. For areas with high power supply reliability, the backup energy storage time of base stations can be set smaller.

How is base station energy storage divided according to availability?

The paper divides base station energy storage into different areas according to availability by establishing four indicators: the supply status of the mains power, the load status of the base station, the state of charge of the energy storage, and the number of charge and discharge times of the energy storage.

Does a base station energy storage model improve the utilization rate?

Where traffic is high,less base station energy storage capacity is available. Compared with the fixed backup time, the base station energy storage model proposed in this article not only improves the utilization rate of base station energy storage, but also reduces the power loss load and power loss cost in the distribution network fault area.

LLVD and BLVD Protection in Base Station Introduction In modern communication networks, base stations, as core infrastructure, are crucial for stable operation. The base station power cabinet ...

IntroductionIn modern communication networks, base stations, as core infrastructure, are crucial for stable operation. The base station power cabinet is a key equipment ensuring continuous ...
