

5G base station communication power requirements

What are the technical requirements for 5G base station chips?

As core components, 5G base station chips must meet the following key technical requirements: 1. High Spectrum Efficiency and Large Bandwidth Support. 5G networks use a broader range of spectrum resources, particularly the millimeter-wave bands (24 GHz and above).

What are the key requirements for 5G infrastructure?

From the trends and challenges mentioned above, we can derive three key general requirements for the 5G infrastructure:

- o High efficiency. Achieving high efficiency is the best way to reduce heat dissipation (due to high power consumption compared to 4G) and operational expenses (OPEX).
- o Re-use of existing infrastructure.

What is a 5G base station?

The goal of 5G networks is to achieve ultra-low latency (as low as 1 ms) and large-scale device connections (up to a million devices per square kilometer). Base station chips must support high-density small cell deployments, meet the massive device access demand, and emphasize high processing speeds and scheduling capability.

Are 5G base station chips compatible with 4G & 6G networks?

5G base station chips must be compatible with 4G, 5G, and future 6G networks, supporting multi-band and technology standard switching to ensure seamless connection between generations of networks.

What should be considered in a 5G network?

The further completion of the map of power models (Fig. 2) and systematization of their features as well as the comparison is also part of the future work. Lastly, the aspects of computing (network function virtualization) and functional split options of the RAN need to be considered for 5G networks as well.

How do engineers design 5G base stations?

Engineers designing 5G base stations must contend with energy use, weight, size, and heat, which impact design decisions. 5G New Radio (NR) uses Multi-User massive-MIMO (MU-MIMO), Integrated Access and Backhaul (IAB), and beamforming with millimeter wave (mmWave) spectrum up to 71 GHz.

To further explore the energy-saving potential of 5G base stations, this paper proposes an energy-saving operation model for 5G base stations that incorporates communication caching ...
