

Civil Code Communication Base Station Wind Power

Do base station antennas reduce tower weight & wind load issues?

Performance factors aside, antennas with better frontal loading design and lesser weight will decrease overall tower weight and wind load issues. Base station antennas add load to the towers not only due to their mass, but also in the form of additional dynamic loading caused by the wind.

Why do wireless operators use wind load data?

That's why wireless operators often use wind load data presented by base station antenna manufacturers when deciding on which antennas to deploy. Therefore, it is important for operators and tower owners to fully understand how wind load data is calculated so fair comparisons can be made between various antennas.

Which states have a state siting authority over wind energy facilities?

B. State Siting. A few states, including Oregon, North Dakota, and Minnesota, have state siting councils or boards that have "one-stop" mandatory siting jurisdiction over permits for wind energy facilities exceeding certain sizes. California has a state siting body that has no jurisdiction over wind energy facilities.

Do wind energy projects receive preferential permitting treatment?

Although wind energy projects are commonly praised for producing green power, they rarely receive preferential permitting treatment. Wind energy projects raise local land use, environmental, and community concerns similar to those raised by other commercial and industrial projects.
