

Inverter grid connection standards

Do solar inverters need to be connected if a grid is unstable?

Old grid connection standards, perhaps influenced by skeptical grid operators, mandated that wind and solar inverters needed to disconnect from the grid if it became unstable. Enter: UL1741, a set of the latest grid connection standards that mandate new inverters stay connected and help out.

Why do we need a standard for inverter energy systems?

It also reflects new developments in inverter technology and the growing prevalence of solar photovoltaic (PV) systems, battery storage, and electric vehicles (EVs). This standard is a crucial component of the safe and reliable connection of inverter energy systems to the national grid.

What is a grid-connected inverter?

In the grid-connected inverter, the associated well-known variations can be classified in the unknown changing loads, distribution network uncertainties, and variations on the demanded reactive and active powers of the connected grid.

Can grid-connected PV inverters improve utility grid stability?

Grid-connected PV inverters have traditionally been thought as active power sources with an emphasis on maximizing power extraction from the PV modules. While maximizing power transfer remains a top priority, utility grid stability is now widely acknowledged to benefit from several auxiliary services that grid-connected PV inverters may offer.

Do solar inverters need to be disconnected from the grid?

With the ever-growing penetration of green energy, solar, and wind power inverters, grid connection standards needed an update. Old grid connection standards, perhaps influenced by skeptical grid operators, mandated that wind and solar inverters needed to disconnect from the grid if it became unstable.

Do I need a design certification report for a high voltage inverter?

Only those inverters that directly connect at high voltage, or rotating machines, are exempt from AS/NZS 4777.1:2024 and are required to meet the high-voltage standard STN W1175. For systems larger than 30 kVA within Energex and Ergon Energy's territory, a Design Certification Report (DCR) or Compliance Report (CR) has to be provided.
