

The role of wind power rectifier modules in communication base stations

When is a rectifier used in telecommunication infrastructure?

In telecommunication infrastructure, rectifiers are employed wherever AC voltages need to be converted to DC voltages to power telecom cells. AC power is used when IT equipment needs to be powered. When DC telecom devices, such as macrocells or small cells, need to be powered, the AC power is converted to DC with a rectifier.

Why do we need a telecom rectifier?

Moreover, with the rise of 5G networks, telecom power demands are increasing, making the development of efficient telecom rectifiers a necessity. Traditional telecom rectifiers typically have an output of 48V DC.

What is the role of a rectifier in 5G?

With the advent of 5G networks and their heavier power demands, the role of rectifiers has become increasingly significant. In telecommunication infrastructure, rectifiers are employed wherever AC voltages need to be converted to DC voltages to power telecom cells. AC power is used when IT equipment needs to be powered.

What is the efficiency rating of a telecom rectifier?

The efficiency rating for telecom rectifiers can usually be pretty high. Unipower and Huawei, for example, provide equipment with an efficiency of up to 96%. This equipment only loses about 4% power that passes through the rectifier as it converts AC to DC power.

What is the future of rectifiers in the telecom industry?

The future of rectifiers in the telecom industry lies in enhancing their efficiency, reliability, and cost-effectiveness. This can be achieved through the use of advanced technologies such as GaN devices, bridgeless PFC topologies, or soft-switching techniques.

What is a boost stage in a telecom rectifier?

The boost stage often exists in the anatomy of a telecom rectifier as a byproduct of active power factor correction (PFC). Power factor needs to be corrected because there are typically reactive power losses along cables that result in voltage drop.

Abstract: The exponential surge in Information Technology (IT) development is driving demand for mobile communication technologies that offer improved access speeds and greater reliability.
